

Summation of feedback for Final Version

Looking through the differing feedback from version 1 the following will present an overview to guide us in the development of the final version.

The main considerations to be implemented are

- Utilizing functions to assist with code efficiency and testing
- Basic GUI to assist with visual aspects of the interaction
- Tidying up the code further with more comments allowing for easy feature expansion when required.
- Input boxes for the user to interact with.

The next stage of development will concentrate on these aspects and envelop them into the existing code.

Key deliverables of final version:

- Successful user interaction with the API via visual GUI
- Accurate weather readings
- Clean and tidy code split into functions which can be added to and adapted as features require.
