

## Version 1.0 - Testing Notes:

### Key Issues:

- Hard coded values
- Quite hard to see in the cmd output - could use some color to make
- We could maybe tidy up the code and add some functions

### Notes:

Tested the current version. Everything looks good in terms of base functionality.

Think we need to start moving towards incorporating some user aspects such as input boxes, maybe a unit selection.

```
"q": "London,UK",
```

```
"units": "metric"
```

Ideally we keep it as simple as possible not to over complicate things but maybe a basic GUI could be a nice direction to head in.

In terms of the code itself. I think we can tidy up and add some functions. Or present the output in a way in which it stands out abit more.

```
PS C:\Users\David\Documents\GitHub\Weather-App>  
The current temperature in London,UK is 17.54°C.
